

GD&T is an essential tool for communicating design intent — that parts from technical drawings have the desired form, fit, function and interchangeability. By providing uniformity in drawing specifications and interpretation, GD&T reduces guesswork throughout the manufacturing process — improving quality, lowering costs, and shortening deliveries. The standard Y14.5-2009 is available through ASME (asme.org) and defines symbols and their applications. All Beaver Aerospace and defense drawings adhere to this standard as part of the overall design.
